

Interview Questions.

- 1.) Why did you rank X as the best visualization?
- 2.) Why did you rank X as the worst visualization?
- 3.) You chose visualization X for far, Y for medium and Z for close distance - what was it about each that made you choose them for that distance?
- 4.) Given a microphone that can detect the direction and distance of sound, and assuming you are wearing headphones or otherwise aurally impaired, what else would you want to use it for to enhance or augment your perception of your aural surroundings? Where, when, why and what sounds would you want to use this for in your general life?
- 5.) Would using this system affect your confidence whilst wearing headphones or other devices that may impair your hearing.
- 6.) Are there any scenarios where you think using this system would be distracting and not appropriate?
- 7.) When, where and when would you not trust the system enough to use it.
- 8.) Do you have any suggestions for improving the visualisations overall or for a specific visualization?
 - a.) For showing the magnitude of a sound
 - b.) For showing the direction of sound
 - c.) What other information about sounds would you want visualised?
- 9.) For the following questions please consider the system integrated into a pair of modern smartglasses capable of full Augmented Reality.
You will be asked to answer questions based on the following scenarios:

Scenario 1: Working in a warehouse with hearing protection whilst moving to locate stationary alarms.

Scenario 2: Standing stationary in a warehouse with hearing protection whilst whilst needing to stay aware of moving vehicles

Scenario 3: Walking along a busy road with headphones on whilst cyclists ring bells near you.

Scenario 4: Sitting in a cafe with headphones on whilst someone calls your name for your order.

For each Scenario:

- a.) Do you think the visualisations would be effective in this scenario
- b.) How would you alter the current visualisations or create a new visualisation to better suit this scenario
